Section 1: Dynamic website building preparation

Legislation, standards and procedures *Identify:* • *One applicable legislation and its relevance to dynamic website development* • *Two applicable standards and its relevance to dynamic website development* • *The procedures that you will follow to develop your dynamic website.*	Applicable Legislation: Privacy Act 1988 (Cth) – This Australian legislation governs the handling of personal information. It is directly relevant because the TennisPro Hub website collects customer data (name, email, phone, address, date of birth, payment card details) through registration forms and checkout processes. The website must ensure data is collected lawfully, stored securely, and used only for its stated purpose (order processing, customer communication). Applicable Standards: 1. WCAG 2.1 (Web Content Accessibility Guidelines) – Ensures the website is accessible to all users, including those with disabilities. The TennisPro Hub implements semantic HTML, proper form labels, keyboard-navigable modals (ESC to close), sufficient colour contrast (dark green #344e41 on light backgrounds), and responsive design for mobile devices. 2. ISO/IEC 27001 (Information Security Management) – Provides a framework for managing sensitive data securely. The website applies this standard through input sanitization (sanitize_text_field, sanitize_email), prepared SQL statements ($wpdb->prepare()), nonce verification for form submissions, restricted admin access via session-based authentication, and .htaccess protection on file upload directories. Procedures: - Requirements analysis: Reviewed the ICTWEB 513 Capstone checklist to identify all mandatory features and pages. - Incremental development: Built features one at a time (home page, products, cart, checkout, forum, support, recruitment, admin dashboard) and tested each before moving to the next. - Version control: Maintained local backups of all theme files and database exports. - Testing: Performed functional testing on each form, verified database insertions, tested email delivery via WP Mail SMTP, and cross-browser testing. - Deployment: Uploaded files to InfinityFree hosting and verified public accessibility.

Dynamic website *Describe the dynamic website you are going to design and develop, including:* • *purpose* • *expectations for the document* • *required functionality.*	Purpose: TennisPro Hub is a full-stack e-commerce website built on WordPress with a custom child theme (tennispro-capstone). It serves as an integrated platform for tennis enthusiasts, offering coaching packages, equipment sales, and court reservation services. The website demonstrates advanced web development skills including CMS customization, custom PHP development, MySQL database integration, RESTful API creation, and cloud deployment. Expectations for the document: - A publicly accessible, live website hosted on InfinityFree (https://amos.fwh.is/) - Complete source code within a custom child theme - A public RESTful API endpoint returning product data in JSON format - Comprehensive documentation, database schema, and ERD diagram - Minimum 20 products, 30 customer records, and 20 forum posts Required Functionality: 1. Product management system with JSON-based storage and full CRUD operations 2. Public REST API endpoint (GET /wp-json/custom/v1/products) 3. User registration via FluentCRM with 9 form fields 4. Shopping cart with AJAX-powered quantity controls (no page reload) 5. Checkout flow with email/phone validation against FluentCRM subscribers 6. Order processing with database storage (wp_orders, wp_order_items) 7. Customer Support page with form submission to wp_support_tickets and automated email confirmation 8. Discussion Forum with topic creation and replies (20+ sample posts) 9. Recruitment/Careers page with job application form and secure CV file upload 10. Admin Dashboard with real-time statistics, inline product CRUD, job application management, support ticket management, user list, and order list 11. Dynamic navigation with authentication-based dropdown (Customer Login / Username / Admin)
User interface design requirements, including user needs, design principles and	User Interface Design Requirements: The TennisPro Hub requires a clean, professional interface with consistent branding across all pages. The design uses a nature-inspired green colour

operating systems B*ased on the business' requirements, analyse and then describe:* • *user interface design requirements for the dynamic website* • *user needs – list at least three.* • *design principles – list at least three* • *operating systems - indicate the system that will be used for web hosting.*	palette reflecting the outdoor tennis environment. All pages share a common header with navigation links, authentication dropdown, and a unified footer. Forms follow a consistent layout with labelled inputs, validation feedback, and styled submit buttons. Product listings use a responsive grid layout with hover effects and modal detail views. User Needs (at least three): 1. Easy product browsing – Customers need to quickly find and view tennis products/services with clear images, prices, and descriptions. Implemented via a responsive product grid with search-friendly categories (Coaching, Equipment, Court booking). 2. Seamless checkout experience – Users need a smooth, intuitive purchasing flow without unnecessary page reloads. Implemented via AJAX cart operations, quantity +/- controls, and a consolidated checkout page with order summary. 3. Account management – Customers need to view their order history and manage saved payment cards. Implemented via a unified Account page showing past orders and saved cards. 4. Quick support access – Users need an easy way to submit inquiries and receive confirmation. Implemented via the Customer Support form with automated email responses. Design Principles (at least three): 1. Consistency – All pages use the same header, footer, colour scheme (#344e41 dark green, #588157 medium green, #f0f3ee light background), typography (system font stack), and button styles (rounded pill shape with hover transitions). 2. Responsive Design – CSS Grid and Flexbox layouts adapt to all screen sizes. Media queries at 768px adjust navigation, product grids, cart layout, and modal dialogs for mobile devices. 3. Feedback & Affordance – Interactive elements provide visual feedback: buttons change colour on hover, product cards lift with shadow on hover, toast notifications confirm cart additions, and form validation errors display inline in styled alert boxes. 4. Progressive Disclosure – Product details are shown in modal overlays (not separate pages), admin dashboard uses tabbed interface to organise complex data without overwhelming the user. Operating System: The website is hosted on InfinityFree, which runs Linux (Apache web server) with PHP 8.x and MySQL 5.7. Development was performed on Windows 10. The website is platform-independent and accessible from any operating system with a modern web browser.

Hierarchy *Provide a diagram of the hierarchy for the website. This can be hand drawn here or developed using software in which case you should attach a screenshot.* *Your hierarchy should also show the navigation for the website.*	Website Hierarchy and Navigation: Home Page (/) ├── Products (/products/) │ └── Product Detail Modal (overlay) ├── Cart (/cart/) │ └── Checkout (/checkout/) │ └── Payment (/payment/) │ └── Account / My Orders (/my-orders/) ├── Customer Support (/support/) ├── About (/about/) ├── Discussion Forum (/forum/) ├── Recruitment (/jobs/) ├── Contact List (/customer-list/) ├── Customer Login (/login/) │ └── Account Page (/my-orders/) ├── Admin Login (/admin-login/) │ └── Admin Dashboard (/admin-dashboard/) │ ├── Tab: Dashboard (metrics, recent orders, top products) │ ├── Tab: Products JSON (inline CRUD) │ ├── Tab: Recruitment (job applications) │ ├── Tab: Support (tickets) │ ├── Tab: All Users (FluentCRM subscribers) │ └── Tab: All Orders (order history) └── Register (/register/) Navigation Bar Structure: [Logo] | Home | Products | Cart | Customer Support | About | Discussion Forum | Recruitment | Contact List | [Auth Dropdown] Auth Dropdown States: - Logged out: Trigger = "Customer Login", Dropdown items = [Admin Login, Register]

	- Customer logged in: Trigger = "[Username]", Dropdown items = [Logout] - Admin logged in: Trigger = "Admin", Dropdown items = [Logout] (See attached hierarchy diagram screenshot)
User interface prototype *Provide a diagram of the user interface website. This cannot be hand drawn here and must be developed using software (Figma) in which case you should attach a screenshot and link to your Figma wireframe including pictures and contents.*	The user interface prototype was developed to plan the layout of all key pages. A wireframe sheet (ui_wireframes.png) was created showing 6 core pages: 1. Home Page: Green header bar with logo, centre navigation links, and auth dropdown on right. Large hero banner with title "Welcome to TennisPro Hub" and subtitle. Two CTA buttons (Browse Products, View Cart). Footer. 2. Products Page: Responsive 3-column product card grid. Each card contains: product image, name, price, description, quantity selector with +/- buttons, "Add to cart" primary button, and "View details" secondary button. 3. Shopping Cart: Two-column layout. Left panel: item table (Product, Unit Price, Quantity with +/- controls, Subtotal) and "Clear cart" button. Right panel: Order Summary with item count, subtotal, shipping fee, total, "Proceed to checkout" and "Continue shopping" buttons. 4. Checkout Page: Two-column layout. Left panel: form fields for Email, Phone, Shipping Address, Billing Address, Payment Method dropdown, Order Notes textarea, and "Continue to payment" button. Right panel: Order Summary. 5. Admin Dashboard: Tabbed interface with 6 panels — Dashboard (metric cards + data tables), Products JSON (inline CRUD table), Recruitment (application list), Support (ticket list), All Users (subscriber list), All Orders (order history). Logout button on far right. 6. Registration Page: 9-field form — First Name | Last Name (side by side), Email, Phone, Address, Country dropdown, Date of Birth | Gender (side by side), Preferred Level dropdown, Subscribe button.

	(See attached wireframe screenshot: ui_wireframes.png)
Website architecture Determine and document the website architecture including: • *technical requirements, for example, server, storage, memory and communication interfaces* • *Functional aspects including the type of services or processes the dynamic website will provide.* • *Visual appearance of the website, for example, colours, buttons and other visual design elements.* • *Security parameters i.e. how the website will ensure secure access control and transactions.*	Technical Requirements: - Server: InfinityFree free-tier hosting (Apache web server, Linux) - Storage: 5GB disk space for WordPress files, theme assets, uploaded CVs, and product images - Memory: Shared hosting with PHP memory limit of 128MB - Communication: HTTPS (SSL certificate provided by InfinityFree), WP Mail SMTP plugin configured for outgoing email delivery via SMTP - Software Stack: WordPress 6.x CMS, PHP 8.x, MySQL 5.7, custom child theme (tennispro-capstone) extending Twenty Twenty-Four parent theme Functional Aspects: - Product Catalogue: Dynamic product listing loaded from products.json, displayed in responsive grid, with AJAX-powered cart operations - REST API: Public endpoint at /wp-json/custom/v1/products returning all products as JSON - User Registration: FluentCRM integration via Fluent Forms (9 fields) - Order Processing: Cart → Checkout (FluentCRM validation) → Payment → Order saved to MySQL - Customer Support: Form saves to wp_support_tickets and sends automated confirmation email - Discussion Forum: Custom PHP forum with topic creation, replies, and 20+ sample posts - Recruitment: Job application form with secure file upload (.pdf/.doc/.docx) - Admin Dashboard: Frontend dashboard with tabbed interface for all management functions Visual Appearance: - Primary colours: Dark green (#344e41), Medium green (#588157), Light green (#dde5cf) - Background: Radial gradient (#f0f3ee to #e7ece4) - Content container: White (#fcfdfb) with 14px rounded corners and subtle

	shadow - Buttons: Pill-shaped (border-radius: 999px), green primary, light secondary - Typography: System font stack (-apple-system, BlinkMacSystemFont, Segoe UI, Roboto, Arial) - Cards: Light background (#f7f8f5), rounded corners, hover lift effect with shadow Security Parameters: 1. Input Sanitization: sanitize_text_field(), sanitize_email(), esc_html(), esc_attr(), esc_url() 2. SQL Injection Prevention: $wpdb->insert() with format specifiers, $wpdb->prepare() 3. CSRF Protection: wp_nonce_field / wp_verify_nonce / check_admin_referer on all POST forms 4. File Upload Security: Extension + MIME type checking; .htaccess with php_flag engine off 5. Access Control: Session-based admin authentication; nonce verification for CRUD 6. XSS Prevention: All output escaped before rendering
Data storage Explain how the data collected through the website will be stored?	Data collected through the website is stored in two primary systems: 1. MySQL Database (7 custom tables): - wp_orders: Order records (id, user_name, total_amount, contact_name, contact_phone, created_at) - wp_order_items: Items within each order (order_id FK, product_id, quantity, unit_price) - wp_support_tickets: Support inquiries (ticket_id, customer_name, customer_email, subject, message, submitted_at, status) - wp_job_applications: Job applications (application_id, full_name, email, phone, position, cover_letter, cv_file_path, submitted_at, status) - wp_forum_posts: Forum topics and replies (id, title, content, author, created_at) - wp_customer_cards: Saved payment card references (customer_email, holder_name, card_brand, card_last4) — only brand + last 4 digits, never full card numbers - wp_fc_subscribers (FluentCRM): Registered customer data (first_name, last_name, email, phone, status, etc.)

	2. JSON File Storage: - /wp-content/uploads/products.json: All product data (id, name, description, price, image_path). Read by product listing and REST API, modified via admin CRUD. 3. File System: - /wp-content/uploads/cv_uploads/: Uploaded CVs with sanitised filenames. Protected with .htaccess. - /wp-content/themes/tennispro-capstone/image/: Product images and site assets. All tables created automatically on theme activation via dbDelta(). See ERD diagram (erd_diagram.png) for relationships.

Section 2: Dynamic website development

Dynamic website development *You are to develop the dynamic website you have planned.* *Using the software you have downloaded, document and upload the codes to Github and Moodle. Attach Github links here.* *Take screenshots of your work to attach to Moodle online text.* *Attach each screenshot of your webpage to the end of this document.* Each student must	The TennisPro Hub was developed using a WordPress child theme (tennispro-capstone) extending Twenty Twenty-Four. All custom code resides within the child theme directory. Key files developed: 1. functions.php (1975 lines) – Core theme logic: AJAX cart endpoint, template routing, REST API, database table creation, product CRUD, FluentCRM integration, navigation/auth 2. style.css (793 lines) – Complete custom styling: header, product grid, cart/checkout layouts, admin dashboard, quantity controls, modal overlay, responsive breakpoints 3. header.php – 3-column flex layout (logo, navigation, auth dropdown) 4. footer.php – Footer with link prefetching JavaScript 5. front-page.php – Home page with banner and slogan 6. template-products.php – Product listing with AJAX add-to-cart, quantity controls, detail modal 7. template-cart.php – AJAX cart with quantity +/- and dynamic re-rendering 8. template-checkout.php – Checkout form with FluentCRM validation and order summary 9. template-payment.php – Payment processing, order saving, card storage 10. template-support.php – Support form with DB insertion and email confirmation (wp_mail) 11. template-jobs.php – Job application form with secure CV file upload 12. template-forum.php – Discussion forum with topic creation and replies 13. template-customer-list.php – FluentCRM subscriber display 14. template-about.php – Company information and map 15. page-admin-dashboard.php – Admin dashboard with 6 tabbed panels (Dashboard, Products JSON, Recruitment, Support, All Users, All Orders) 16. products.json – 20 product records with id, name, description, price, image_path Live website: https://amos.fwh.is/ API endpoint: https://amos.fwh.is/wp-json/custom/v1/products [SCREENSHOTS TO ATTACH]:

Welcome to TennisPro Hub
TennisPro Hub is an integrated e-commerce platform designed to serve tennis enthusiasts by offering a one-stop solution for tennis training, equipment, and facility bookings.
Our platform combines high-quality tennis coaching services, a curated selection of tennis rackets and accessories, and a seamless online court reservation system.
Who is this for?
We target amateur and professional players aged 18–45, college athletes, fitness lovers, parents seeking lessons for their children, and corporate clients organizing tennis events.
Why TennisPro Hub?
Our unique value comes from combining coaching services, equipment sales, and court bookings in a single platform.

Styling

You are to style your dynamic documents using the software you have selected.

Summarise the details of your styling work here. List at least 7 improvements to CSS.

Take 2 screenshots of your work to attach to your portfolio. Including annotations to improvements.
</td>
<td>
CSS styling was implemented in the child theme's style.css (793 lines). Seven key improvements:

1. Custom Header Layout: 3-column flex layout (logo | nav | auth dropdown) with dark green gradient background (linear-gradient(120deg, #344e41, #588157)). Navigation links use pill-shaped hover effects with semi-transparent white backgrounds.

2. Responsive Product Grid: CSS Grid with auto-fill columns (minmax(220px, 1fr)) — 4 columns on desktop, 1 on mobile. Product cards feature hover lift effect (translateY(-4px)) with enhanced box-shadow transition.

3. Quantity Control Styling: Custom +/- controls using inline-flex containers with pill borders (border-radius: 999px), 34px button sizing, colour-coordinated backgrounds (#dde5cf buttons, #fff input).

4. Modal Overlay Design: Fixed-position overlay with semi-transparent backdrop (rgba(0,0,0,0.55)), 16px rounded corners, responsive two-column grid (320px image + info panel), collapses to single column on mobile.

5. Cart & Checkout Two-Column Layouts: CSS Grid (2fr + minmax(260px, 1fr)) for clear visual separation between item details and order summary.
</td>
</tr>
</table>

	Rounded containers with subtle shadows. 6. Admin Dashboard Tab Styling: Consistent tab interface with inline style overrides — active tab green (#588157), inactive light green (#dde5cf), logout warm beige (#e8e0d4). No borders, no outlines. 7. Authentication Dropdown: Hover-activated dropdown with CSS transitions (opacity 0.15s), absolute positioning below trigger, smooth visibility toggling. Menu items with rounded hover backgrounds. 8. Mobile Responsive: @media (max-width: 768px) rules reorganise header, switch layouts to single column, adjust image heights. [SCREENSHOTS TO ATTACH]:

Testing *You are to test each component of the website that you have developed. Describe the testing process for each component here.* *Number and list your testing procedures.*	Testing procedures for each component: 1. Product Listing: Verified 20 products load from products.json, images display correctly, prices formatted, detail modal opens/closes with ESC key support. 2. AJAX Cart: Tested add-to-cart (toast notification appears with item count), quantity +/- in cart (subtotal and total update instantly without page reload), clear cart (cart empties immediately). 3. Checkout Flow: Tested empty field validation, invalid email rejection, FluentCRM subscriber verification (valid email+phone passes; invalid shows error), session data persists to payment page. 4. Payment & Order: Verified card details captured, order saved to wp_orders + wp_order_items, cart cleared, card saved to wp_customer_cards (brand + last 4 digits only), redirect to account page with success message. 5. Customer Support: Tested form submission → record in wp_support_tickets → confirmation email received via WP Mail SMTP. Tested validation (empty fields rejected, invalid email rejected). 6. Job Application: Tested valid uploads (.pdf accepted), invalid uploads (.jpg rejected), verified sanitised filename in cv_uploads directory, data in wp_job_applications table. 7. Forum: Tested topic creation, verified 20+ posts display, tested guest posting. 8. Admin Dashboard: Tested all 6 tabs, inline product create/update/delete, job application status update, support ticket status update. 9. REST API: GET /wp-json/custom/v1/products returns valid JSON, 20 products, correct Content-Type. 10. Registration: All 9 fields submit, data saved to FluentCRM. [SCREENSHOTS TO ATTACH]:

Integration *You are to integrate all components to produce the final product.* *Describe the integration process here.* *Take screenshots of your work to attach to your portfolio. For instance, before and after db integration.*	Integration process connecting all components: 1. Theme Integration: All templates integrated via template_redirect hooks in functions.php, ensuring consistent header/footer across all pages while bypassing block theme rendering. 2. Database Integration: after_switch_theme hook auto-creates all 6 custom tables and seeds forum with 20 sample posts via dbDelta(). Tables are ready immediately on theme activation. 3. FluentCRM Integration: Registration form (Fluent Forms) saves to wp_fc_subscribers. Checkout validates customer by querying this table. Admin dashboard displays subscriber counts and lists. 4. AJAX Integration: Cart operations (add, update, clear) use WordPress AJAX endpoints (wp_ajax_tennispro_cart) for real-time updates. Product page and cart page share the same backend endpoint. 5. Email Integration: WP Mail SMTP handles outgoing emails. Support form triggers wp_mail() for confirmation. FluentCRM sends welcome emails to new subscribers. 6. REST API Integration: Endpoint registered via rest_api_init, reads from products.json. Same tennispro_get_products() function used by API and product listing page. 7. Navigation Integration: Header dynamically adjusts login state via tennispro_auth_ui() — checks session variables, returns trigger label and dropdown items. 8. File System Integration: Product images from child theme image/ directory. CVs in wp-content/uploads/cv_uploads/ with .htaccess. products.json in wp-content/uploads/ with fallback in child theme. Section 3: Dynamic website testing and finalisation

Testing *You are to test the website you have developed and check it meets the business' requirements.* *List and describe the tests you have undertaken.* *Take annotated screenshots of your work to attach to your portfolio*	Tests performed to verify business requirements: 1. Functional Testing: - All 8 mandatory pages load correctly (Home, About, Products, Cart, Checkout, Support, Forum, Recruitment) - Product CRUD works in Admin Dashboard (create, read, update, delete) - Shopping flow completes end-to-end: browse → add to cart → checkout → payment → order confirmation - All forms submit and save to appropriate database tables - REST API returns valid JSON with 20 products 2. Data Validation Testing: - Empty fields rejected with error messages - Invalid email formats rejected (is_email()) - File uploads enforce .pdf/.doc/.docx only (extension + MIME check) - Product prices must be positive numbers - Checkout requires valid FluentCRM subscriber match 3. User Experience Testing: - AJAX cart updates without page reload - Product modal opens/closes correctly, one at a time - Toast notifications for cart additions - Navigation dropdown appears on hover, hides on mouse leave - Admin dashboard tabs switch smoothly 4. Data Integrity Testing: - Orders saved with correct totals and item details - Support tickets record all fields including timestamp - Job applications store file paths correctly - Forum posts display in reverse chronological order - Customer cards store only brand and last 4 digits

	[SCREENSHOTS TO ATTACH]: Screenshot H: Complete shopping flow (Cart → Checkout → Payment → Order confirmation) Screenshot I: Admin Dashboard showing order data matches what was placed
Security *You are check the website to ensure it is secure.* *List and describe the tests you have undertaken to ensure security.* *The tests should also follow procedures for cyber security. Describe how you have ensured you follow procedures.* *Take annotated screenshots of your work to attach to your portfolio*	Security tests performed: 1. Input Sanitisation Testing: - Tested HTML injection in form fields — all inputs sanitised via sanitize_text_field() and esc_html() - Tested SQL injection attempts — all queries use $wpdb->insert() with format specifiers or $wpdb->prepare() - Tested XSS via form inputs — all output escaped with esc_html(), esc_attr(), esc_url() 2. CSRF Protection Testing: - Verified all POST forms include wp_nonce_field - Verified wp_verify_nonce / check_admin_referer before processing - Tested form submission without valid nonce — rejected 3. Access Control Testing: - Admin Dashboard redirects to login if not authenticated - Customer List requires user login - Admin CRUD requires valid nonce 4. File Upload Security Testing: - .php files rejected (extension check) - Renamed .jpg to .pdf — rejected (MIME type check) - cv_uploads contains .htaccess with "php_flag engine off" - Uploaded files have sanitised filenames 5. Session Security:

	- Admin login clears customer session - Logout clears all session variables 6. Cyber Security Procedures Followed: - OWASP Top 10 guidelines applied - Principle of least privilege (admin features restricted) - Defence in depth (client + server + database validation) - HTTPS for all communications [SCREENSHOTS TO ATTACH]:  Debugging *You are check the website to ensure it is bug free.* *Describe the validation process you undertook to ensure that there are no errors.* *The tests should also follow procedures for cyber security. Describe how you have*	Debugging and validation process: 1. PHP Syntax Validation: Used php -l (lint) on all PHP files — all passed with no errors. 2. HTML Validation: Verified output using browser DevTools (F12). Checked for unclosed tags, proper form structures, alt attributes on images, labels on inputs.

ensured you follow procedures. *Take annotated screenshots of your work to attach to your portfolio*	3. CSS Debugging: Used DevTools to identify specificity conflicts with parent theme (Twenty Twenty-Four). Resolved with higher specificity selectors and !important. Verified responsive breakpoints at 768px. 4. JavaScript Debugging: Used browser console to debug AJAX cart operations. Verified fetch() returns correct JSON. Tested modal and event listeners. 5. Database Debugging: Verified table creation in phpMyAdmin. Checked INSERT operations return correct IDs. Verified order_items link to orders correctly. 6. Common Issues Resolved: - Blank page after login → Fixed with template_redirect hooks to bypass block theme - CSS button borders on admin tabs → Fixed with inline styles and JavaScript-managed styles - Cart +/- causing blank page → Fixed by converting POST forms to AJAX fetch() calls - Session not persisting → Fixed by calling session_start() in init hook priority 1 - Product images not showing → Fixed path normalisation (images/ → image/ mapping) 7. All debug output removed before deployment. WP_DEBUG set to false in production. No sensitive data in client-side code. 
Browser and devices *You are to test that your dynamic website work on:* • *Two different types of browsers* • *Two different types of browsers* *List the two browsers you tested your dynamic website on and the two devices.* *Take annotated screenshots of your work to attach to your portfolio*	Browsers tested: 1. Google Chrome (Version 131.x, Windows 10): - All pages render correctly with proper layout - AJAX cart works smoothly - Product modal displays correctly - Admin dashboard tabs function properly - CSS Grid layouts render as expected 2. Microsoft Edge (Version 131.x, Windows 10): - All pages render identically to Chrome - Form submissions and redirects work correctly - Dropdown hover effects function properly - File upload works correctly Devices tested: 1. Windows 10 Desktop (1920x1080): - Full desktop layout with multi-column grids - Header shows all navigation links in single row - Product grid shows 4 columns - Cart/checkout show two-column layout 2. Mobile (tested via Chrome DevTools at 375px width): - Header wraps navigation below logo - Product grid collapses to single column - Cart/checkout switch to stacked layout

	- Modal uses full-width single column - All buttons and forms work on touch - Text readable without horizontal scrolling

<td>Feedback

Document an email to your assessor here, asking for feedback on your final dynamic website.

Provide the link to your website.</td>
<td>Dear Chuan,

I hope this email finds you well. I have completed the development of my ICTWEB 513 Capstone Project — TennisPro Hub, a full-stack e-commerce website built with WordPress and custom PHP.

The website is live and accessible at: https://amos.fwh.is/

Key features implemented:

- 20 products with JSON storage and REST API

- Shopping cart with AJAX operations (no page reloads)

- Checkout with FluentCRM email+phone validation

- Customer Support form with database storage and email confirmation

- Discussion Forum with 20+ posts

- Job Application form with CV upload (.pdf/.doc/.docx)

- Admin Dashboard with full CRUD and management features

- 30+ registered customers in FluentCRM

- 9-field registration form

Admin access:

- Admin Login: https://amos.fwh.is/admin-login/

- Username: admin

- Password: admin123

API endpoint: https://amos.fwh.is/wp-json/custom/v1/products</td>
</tr>
</table>

	WordPress backend: - URL: https://amos.fwh.is/wp-admin/ - (Use WordPress admin credentials) I would appreciate your feedback on the website's functionality, design, and any areas for improvement before final submission. Thank you for your time and guidance throughout this project. Best regards, Amos
Update *Describe the feedback you received from your assessor here.* *Explain how you updated the website based on this feedback.* *Provide a link to the finalised dynamic website.*	Based on assessor feedback, the following updates were made: 1. Registration Form Enhancement: Added fields (Address, Country, Date of Birth, Preferred Level, Gender) to meet minimum 8-field requirement — total is now 9 fields. 2. Security Improvement: Added .htaccess to cv_uploads directory to prevent PHP execution of uploaded files. 3. Performance Optimisation: Implemented link prefetching on hover. Removed page transition overlay that caused white screen flashes. 4. Admin Dashboard Polish: Unified all tab button styling (removed black borders). Added Support tab with inline ticket management. Removed duplicate Customers tab. 5. Cart UX Improvement: Converted all cart operations from POST form submissions to AJAX requests — no page reloads, instant feedback via toast notifications. 6. Navigation Cleanup: Streamlined nav bar labels. Implemented dynamic auth dropdown (Customer Login / Username / Admin with hover sub-menu). Finalised website: https://amos.fwh.is/

	[SCREENSHOTS TO ATTACH]: Screenshot R: Before vs After comparison of any improvement
Attach:	Include *annotated* Screenshots (write on your screenshot to number testing procedures or indicate changes) ☐
